VisAnalytics

FlowVis

- 186.827 Visualisierung 1, VU
 - ◆ 3.0 ECTS, 2 hours, lecture + exercises
 - ◆ 033 532 Medieninformatik und Visual Computing
 - ◆ <http://www.cg.tuwien.ac.at/courses/Visualisierung1/VU.html>
 - ◆ <https://tiss.tuwien.ac.at/course/courseDetails.xhtml?courseNr=186827>

- Dates lecture part
 - ◆ 1. 08.10: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 2. 22.10: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 3. 29.10: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 4. 05.11: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 5. 12.11: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 6. 19.11: 09:15-10:45, EI 10 Fritz Paschke
 - ◆ 7. 03.12: 09:15-10:45, EI 10 Fritz Paschke

■ Exercises

- ◆ Three simple programming tasks concerning visualization pipeline
- ◆ Framework is available
- ◆ Reference solutions will be provided
- ◆ Three dates to hand in the programming task
- ◆ Details:

<http://www.cg.tuwien.ac.at/courses/Visualisierung1/MU.html>

■ Grading

- ◆ Oral exam (colloquy) early in January (topic: programming assignments, lecture content)

- WS2012 together with Visualisierung 1
- Exceptionally and only once
- Registration in Tiss through Visualisierung 1
- Grade for appropriate course will be issued
- Exemption from the exception possible (if not too many candidates)
 - ◆ Only for students who already took Visualisierung (1) [186.138, 186.004]
 - ◆ Can do Wissenschaftliches Arbeiten (186.828)
 - ◆ <http://www.cg.tuwien.ac.at/courses/WissArbeiten/index.html>
 - ◆ Will get topic from medical visualization

The purpose of computing
is **insight**, not numbers
[R. Hamming, 1962]

■ Visualization:

- ◆ **Tool** to enable a **User** insight into **Data**
- ◆ to form a **mental vision, image, or picture** of (something not visible or present to the sight, or of an abstraction); to make **visible to the mind or imagination** [Oxford Engl. Dict., 1989]
- ◆ **Computer Graphics,**
but not photorealistic rendering

■ Background:

- ◆ Visualization = rather old
- ◆ Often an intuitive step: graphical illustration
- ◆ Data in ever increasing sizes \Rightarrow graphical approach necessary
- ◆ Simple approaches known from business graphics (Excel, etc.)
- ◆ Visualization = own scientific discipline since 20 years
- ◆ First dedicated conferences: 1990

1997

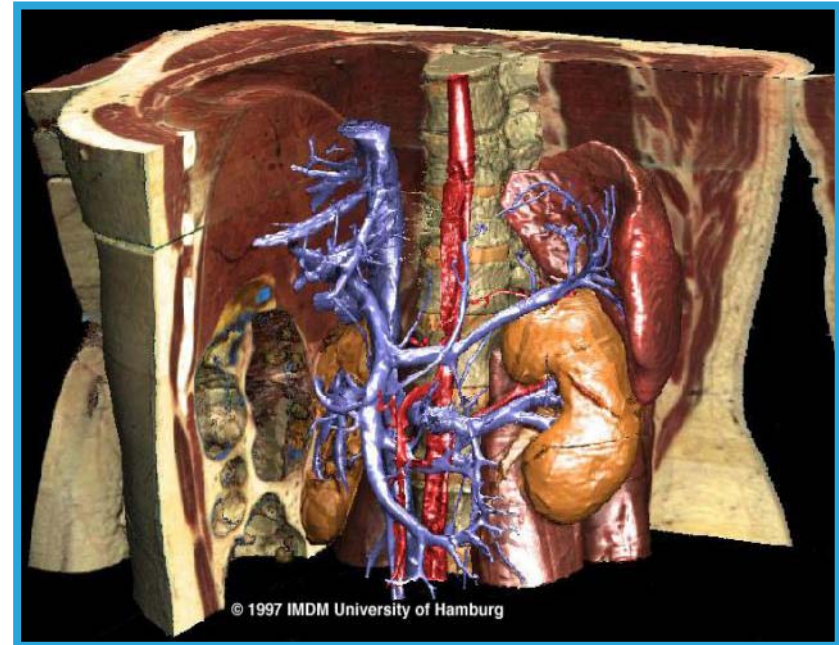

- Visualization of ...
 - ◆ Medical data \Rightarrow VolVis!
 - ◆ Flow data \Rightarrow FlowVis!
 - ◆ Abstract data \Rightarrow InfoVis!
 - ◆ GIS data
 - ◆ Historical data (archeologist)
 - ◆ Microscopic data (molecular physics),
Macroscopic data (astronomy)
 - ◆ Extrem large data sets
- etc. ...

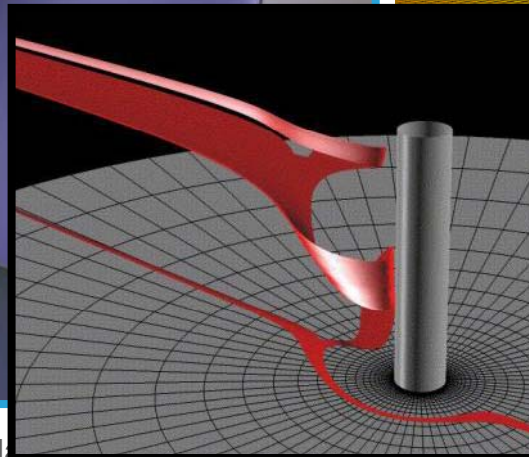

Visualization – Examples

■ Medical data

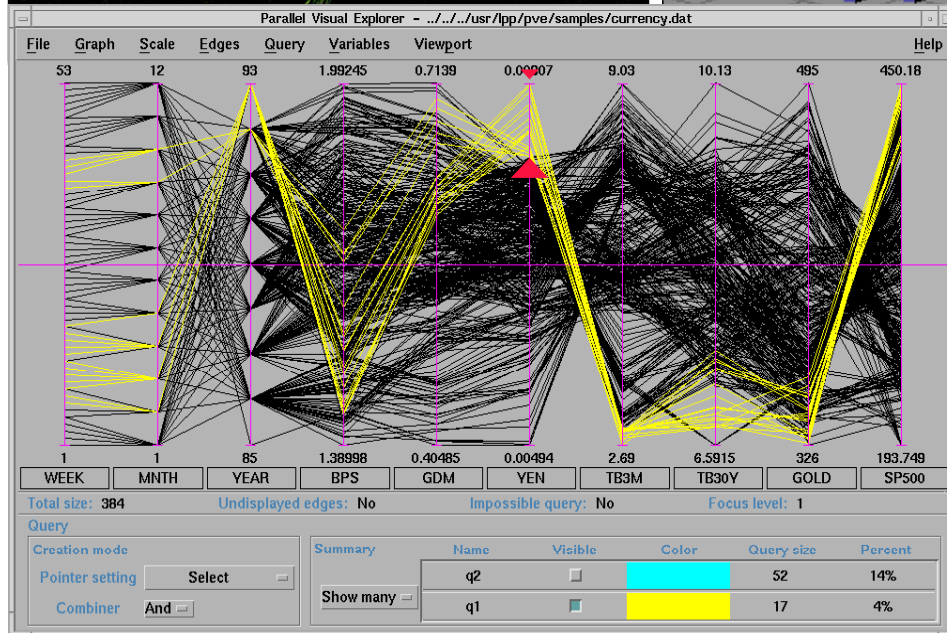

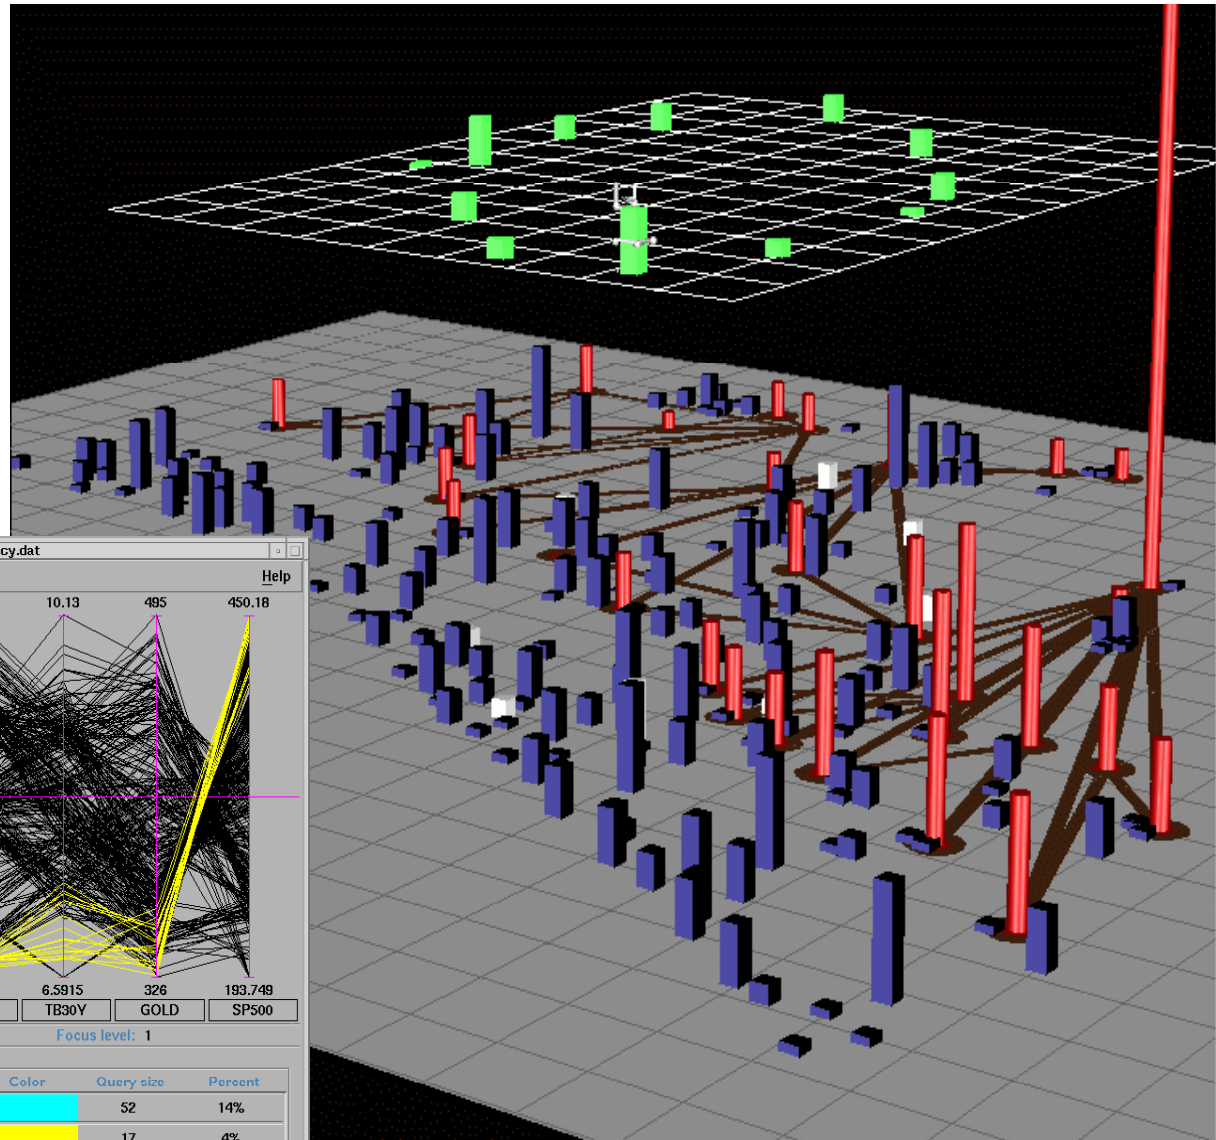

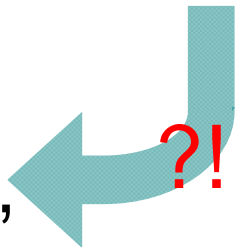

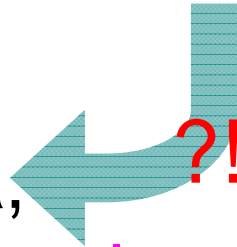

Visualization – Examples

■ Flow data

■ Abstract data

- Visualization, ...
 - ◆ ... to **explore**
 - Nothing is known,
Vis. used for **data exploration**
 - ◆ ... to **analyze**
 - There are hypotheses, 
Vis. used for **Verification or Falsification**
 - ◆ ... to **present**
 - “everything” known about the data, 
Vis. used for **Communication of Results**

■ Major areas

- ◆ Volume Visualization
- ◆ Flow Visualization

Scientific Visualization

Inherent spatial reference

3D

-
- ◆ Information Visualization
 - ◆ Visual Analytics

nD

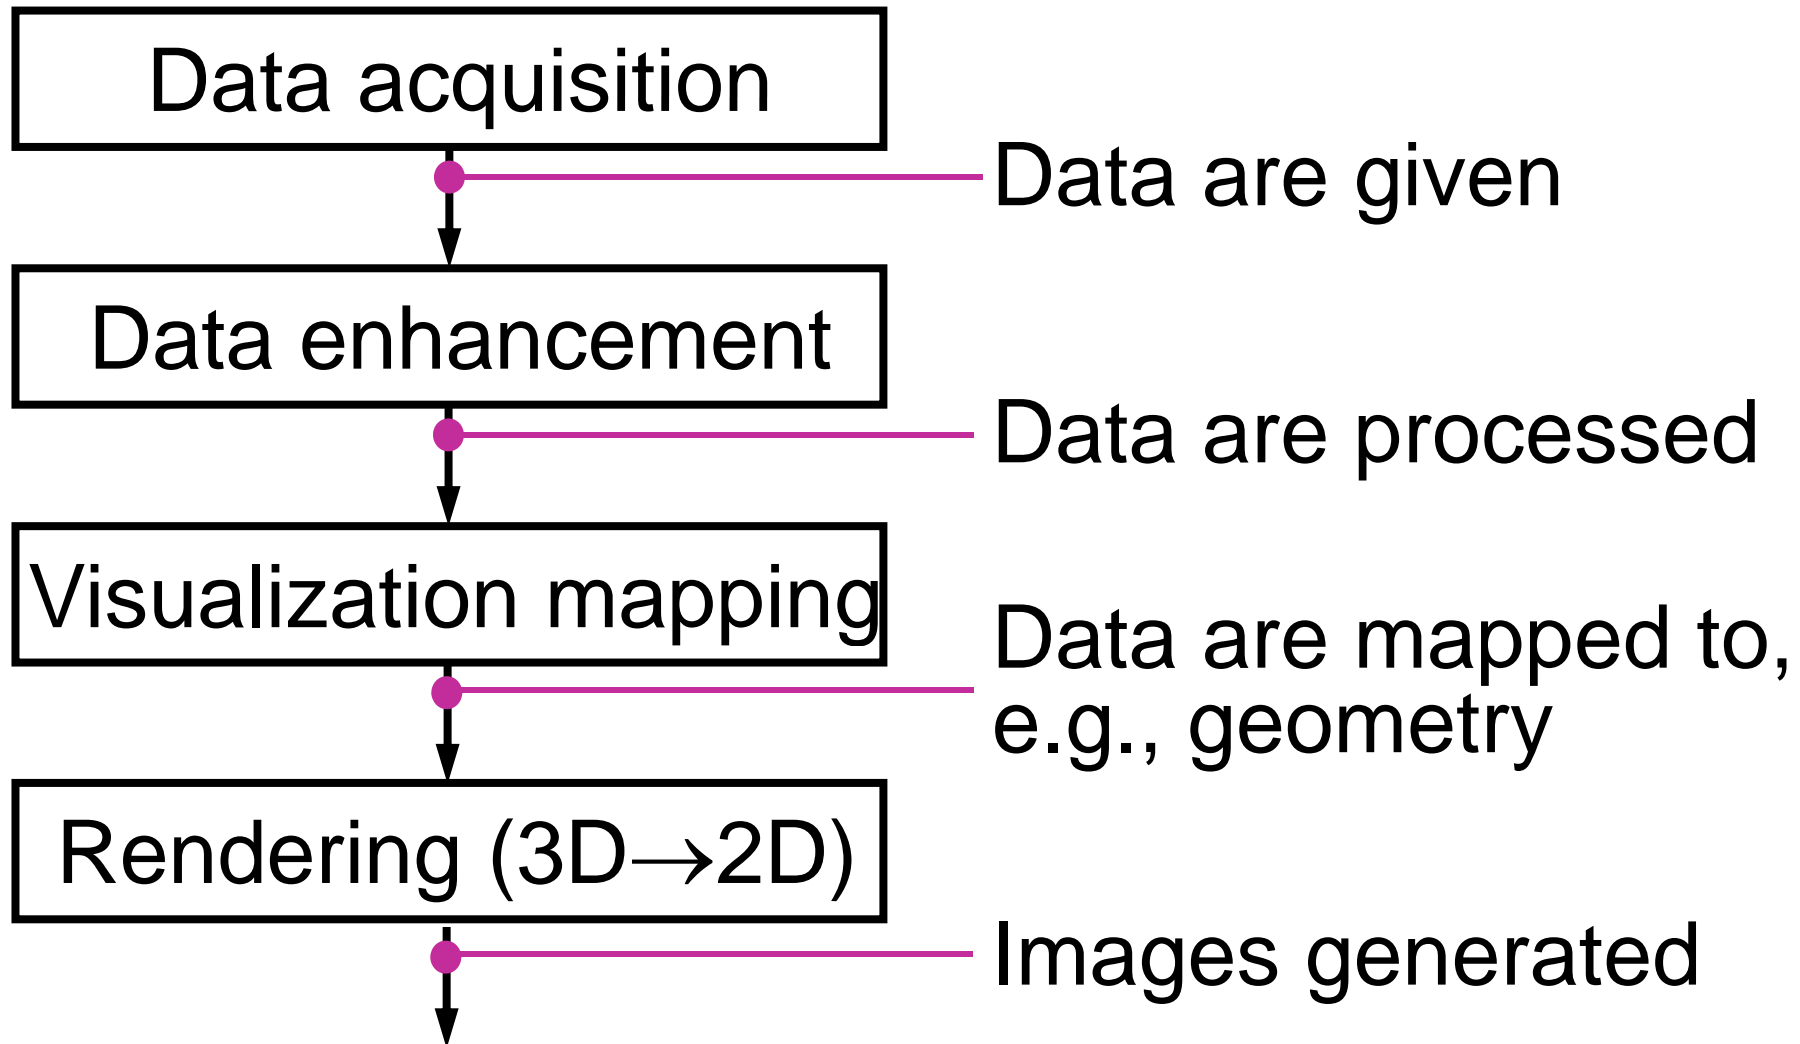

Usually no spatial reference

Visualization Pipeline

Typical steps in the
visualization process

- Data acquisition
 - ◆ Measurements, e.g., CT/MRI
 - ◆ Simulation, e.g., flow simulation
 - ◆ Modelling, e.g., game theory

■ Data enhancement

- ◆ Filtering, e.g, smoothing (noise suppression)
- ◆ Resampling, e.g., on a different-resolution grid
- ◆ Data Derivation, e.g., gradients, curvature
- ◆ Data interpolation, e.g., linear, cubic, ...

- Visualization mapping = data is renderable
 - ◆ Iso-surface calculation
 - ◆ Glyphs, Icons determination
 - ◆ Graph-Layout calculation
 - ◆ Voxel attributes: color, transparency, ...

- Rendering = image generation with Computer Graphics
 - ◆ Visibility calculation
 - ◆ Illumination
 - ◆ Compositing (combine transparent objects, ...)
 - ◆ Animation

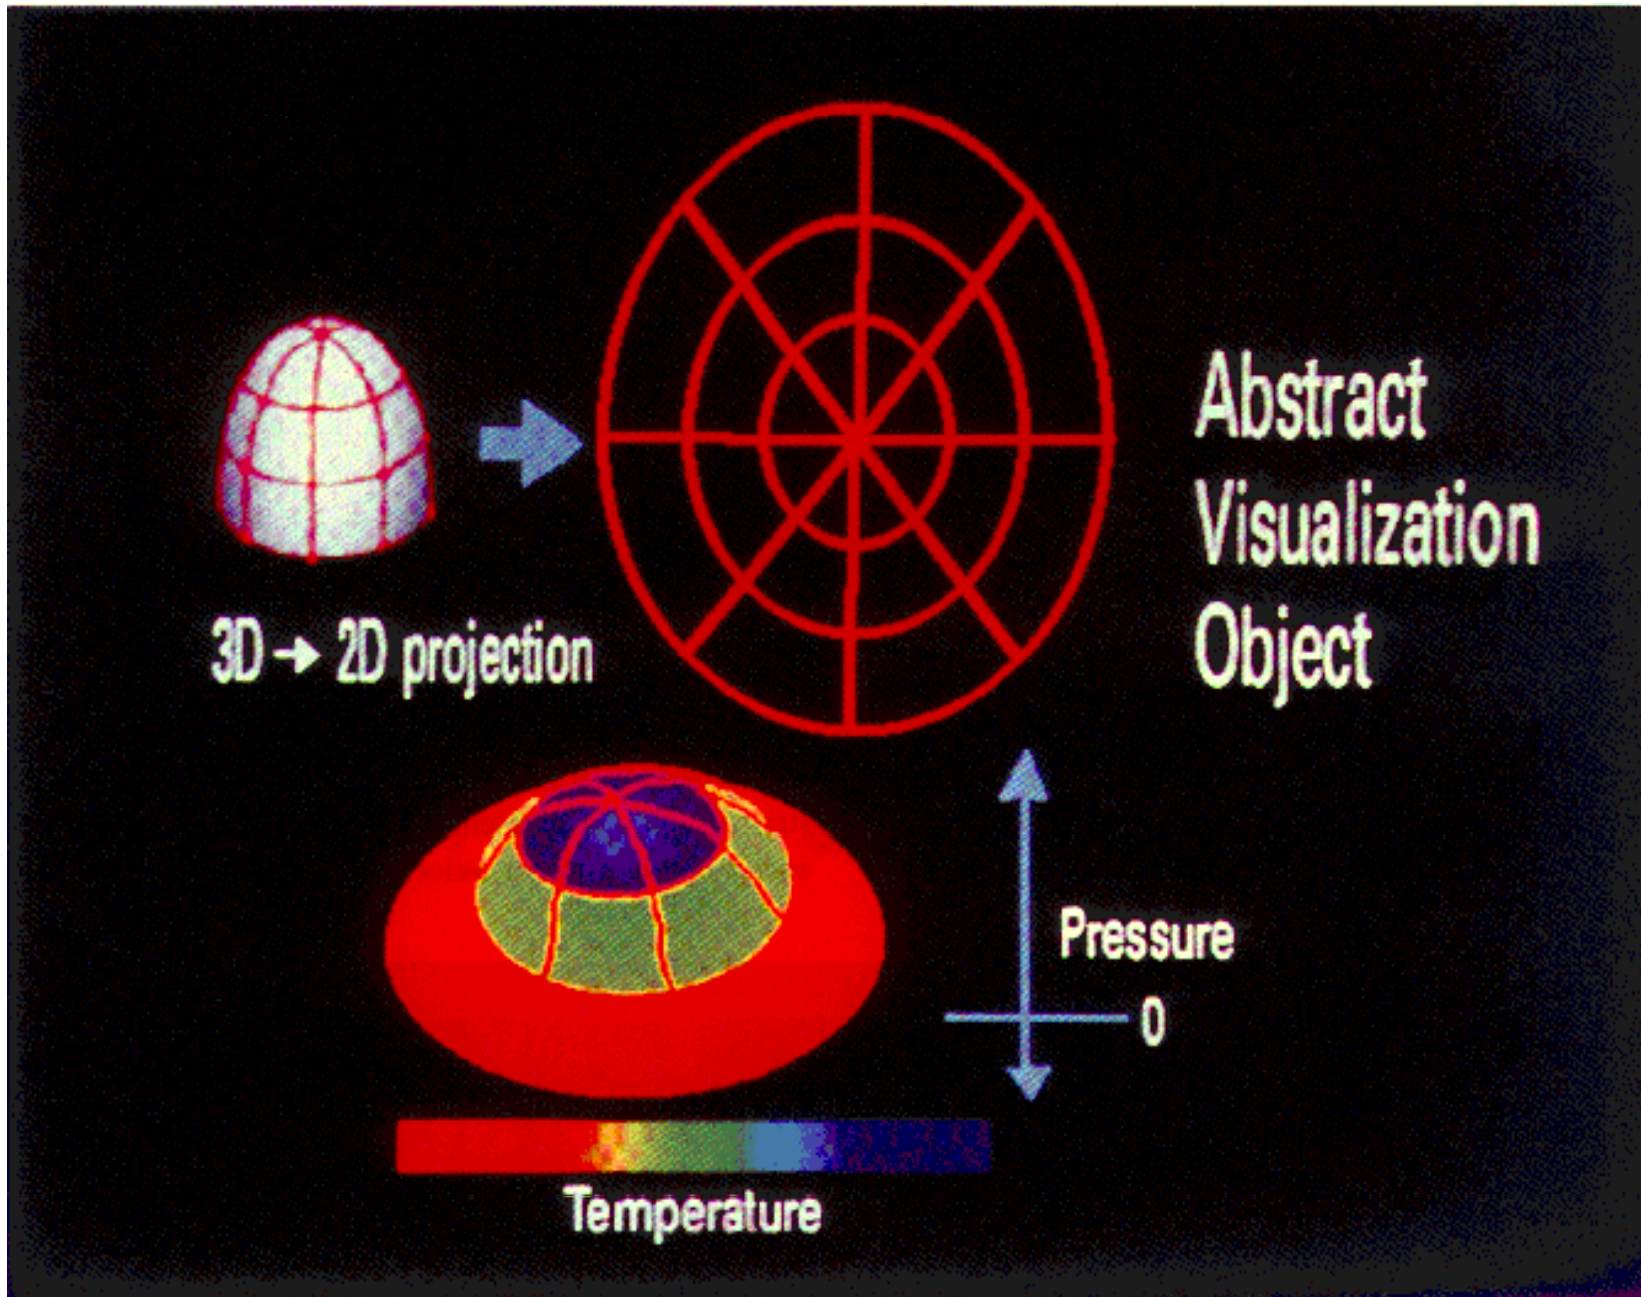

DERIVED DATA

Geometry: Polygonal Patches
(Vertices at X, Y, Z)

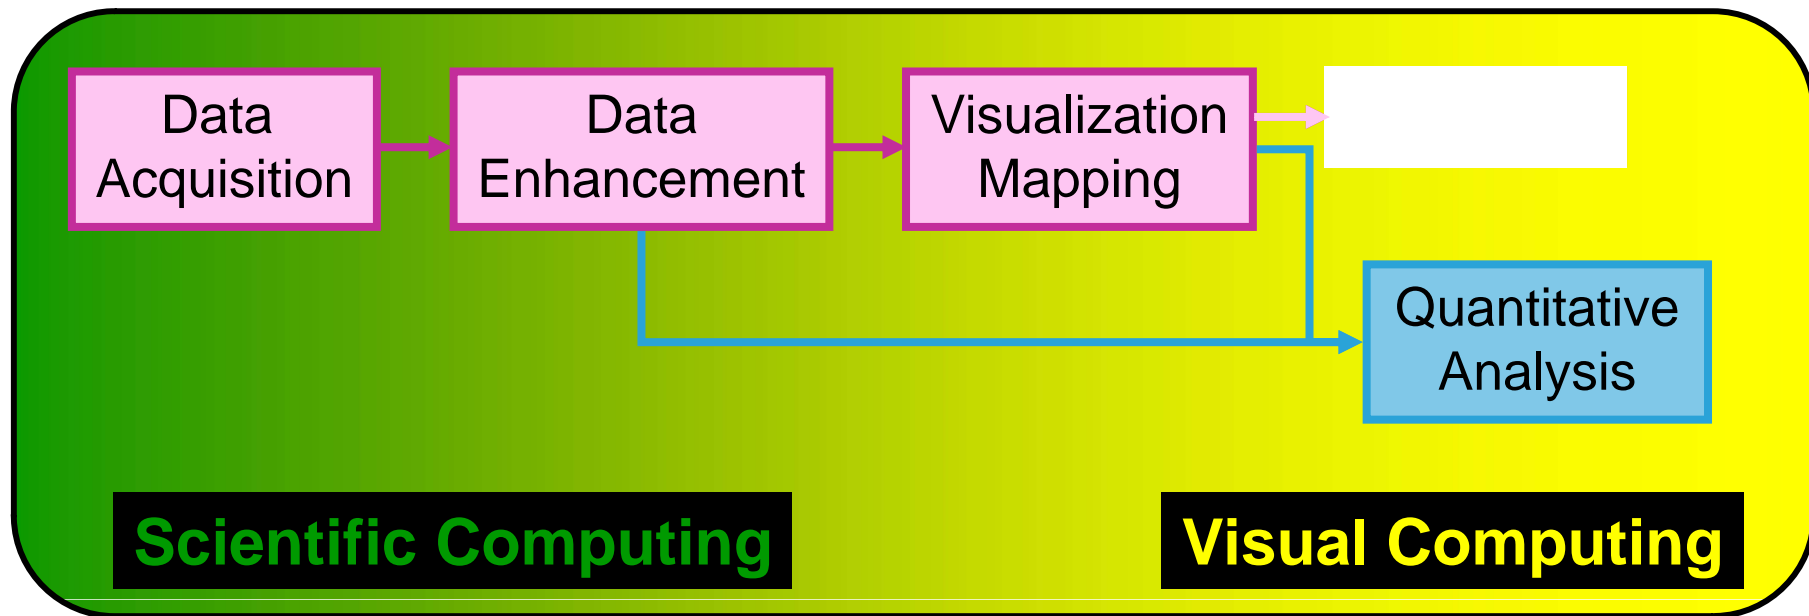

Data at Vertices:
Temperature, Pressure
(Regular in Time)

Computational Sciences

- Visual Computing
 - ◆ Scientific visualization
 - ◆ Computer vision
 - ◆ Human computer interaction

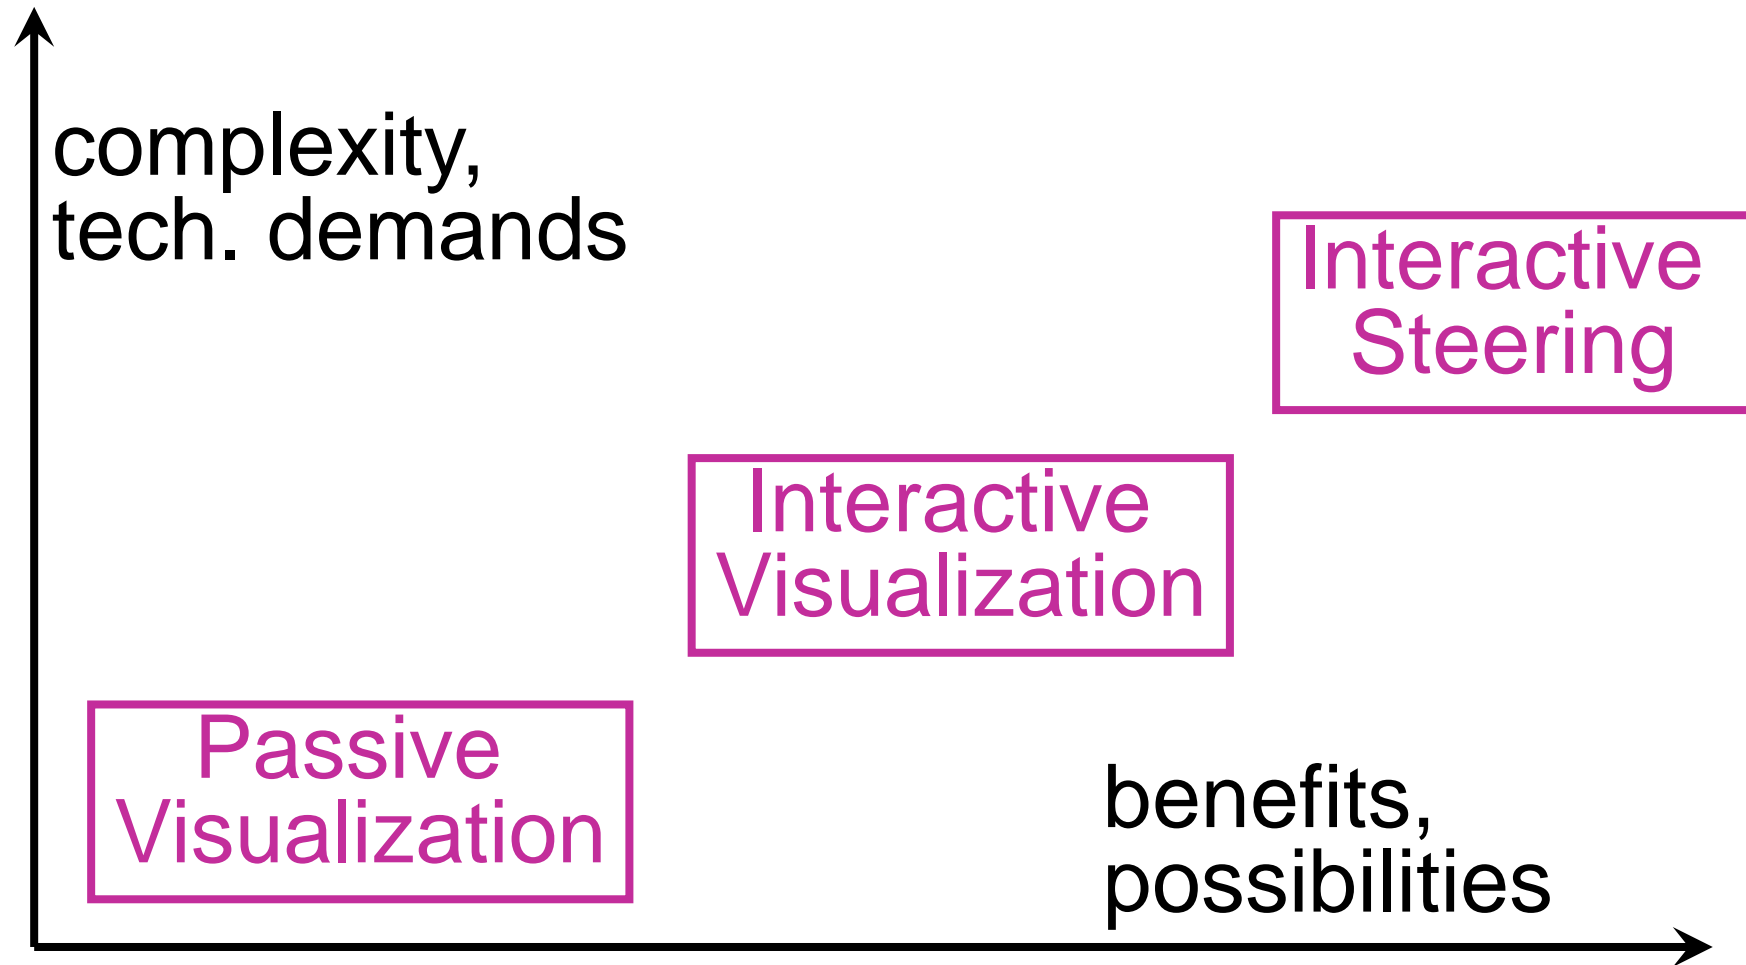

Visualization Scenarios

How closely is visualization connected to the data generation?

- Coupling varies considerably:
 - ◆ Data generation (data acquisition):
 - Measuring, Simulation, Modelling
 - Can take very long (measuring, simulation)
 - Can be very costly (simulation, modelling)
 - ◆ Visualization (rest of visualization pipeline):
 - Data enhancement, vis. mapping, rendering
 - Depending on computer, implementation: fast or slow
 - ◆ Interaction (user feedback):
 - How can the user intervene, vary parameters

On Data

Data characteristics,
Data attributes,
Data spaces

■ Data:

- ◆ Focus of visualization, everything is centered around the data
- ◆ Driving factor (besides user) in choice and attribution of the visualization technique
- ◆ Important questions:
 - Where do the data “live” (**data space**)
 - **Type** of the data
 - Which **representation** makes sense (secondary aspect)

- Where do the data “live”?
 - ◆ Inherent spatial domain (**SciVis**):
 - 2D/3D data space given
 - Examples: medical data, flow simulation data, GIS-data, etc.
 - ◆ No inherent spatial reference (**InfoVis**):
 - Abstract data, spatial embedding through visualization
 - Example: data bases
 - ◆ **Aspects**: dimensionality (data space), coordinates, region of influence (local, global), domain

■ What type of data?

◆ **Data types:**

- Scalar = numerical value (natural, whole, rational, real, complex numbers)
- Non numerical (nominal, ordinal values)
- Multidimensional values (n-dim. vectors, $n \times n$ -dim. tensors of data from same type)
- Multimodal values (vectors of data with varying type [e.g., row in a table])

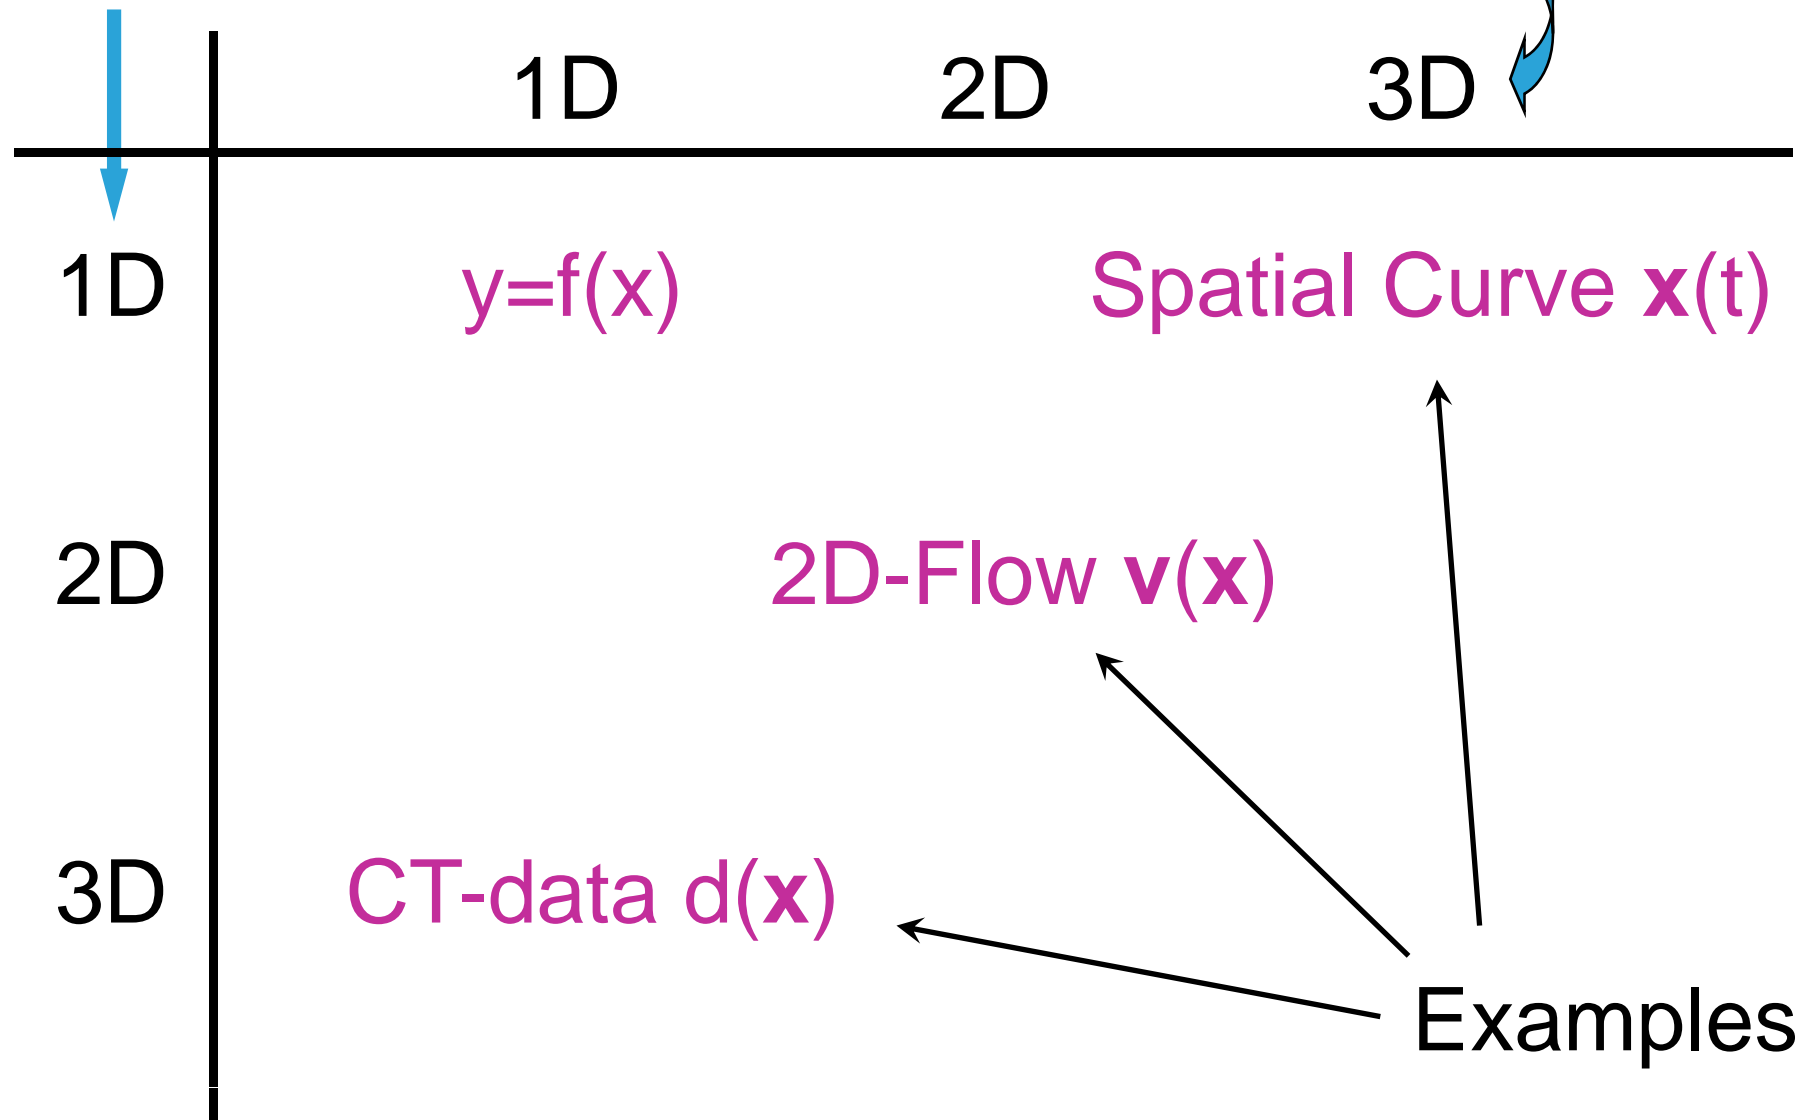

◆ **Aspects:** dimensionality, co-domain (range)

- How can data be represented?
 - ◆ inherent spatial domain?
 - Yes \Rightarrow Recycle data space? Or not?
 - No \Rightarrow Select which representation space?
 - ◆ Which dimension is used what for?
 - Relationship data space \Leftrightarrow data characteristics
 - Available display space (2D/3D)
 - Where is the focus?
 - Where can you abstract / save (e.g., too many dimensions)

Data Space vs. Data characteristics

data	description	visualization example
$\mathbb{N}^1 \rightarrow \mathbb{R}^1$	value series	bar chart, pie chart, etc.
$\mathbb{R}^1 \rightarrow \mathbb{R}^1$	function	(line) graph
$\mathbb{R}^2 \rightarrow \mathbb{R}^1$	function over \mathbb{R}^2	2D-height map in 3D, contour lines in 2D, false color map
$\mathbb{N}^2 \rightarrow \mathbb{R}^2$	2D-vector field	hedgehog plot, LIC, streamlets, etc.
$\mathbb{R}^3 \rightarrow \mathbb{R}^1$	3D-densities	iso-surfaces in 3D, volume rendering
$(\mathbb{N}^1 \rightarrow) \mathbb{R}^n$	set of tuples	parallel coordinates, glyphs, icons, etc.

Visualization Examples

$(\mathbb{N}^1 \rightarrow) \mathbb{R}^n$

set of tuples

parallel coordinates, glyphs, icons, etc.

On Grids

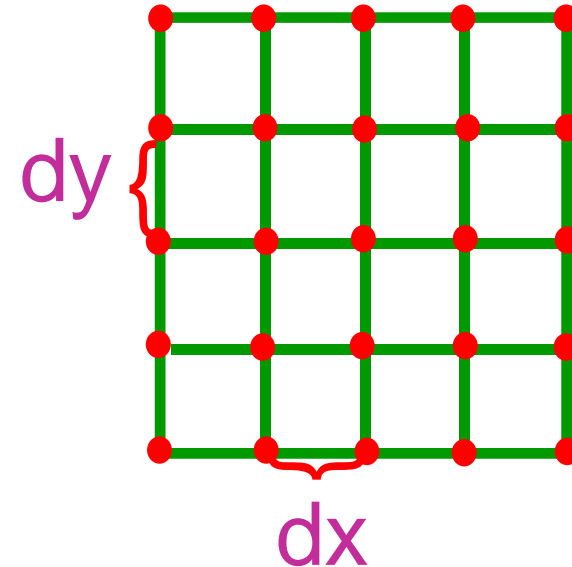

On the organisation of sampled data

- Important questions:
 - ◆ Which data organisation is optimal?
 - ◆ Where do the data come from?
 - ◆ Is there a neighborhood relationship?
 - ◆ How is the neighborhood info. stored?
 - ◆ How is navigation within the data possible?
 - ◆ Calculations with the data possible ?
 - ◆ Are the data structured?

- Characteristics:
 - ◆ Orthogonal, equidistant grid
 - ◆ Uniform distances (in all dims., $dx=dy$)
 - ◆ Implicit neighborhood-relationship (cf. array of arrays)

■ Regular Grid

- ◆ $dx \neq dy$

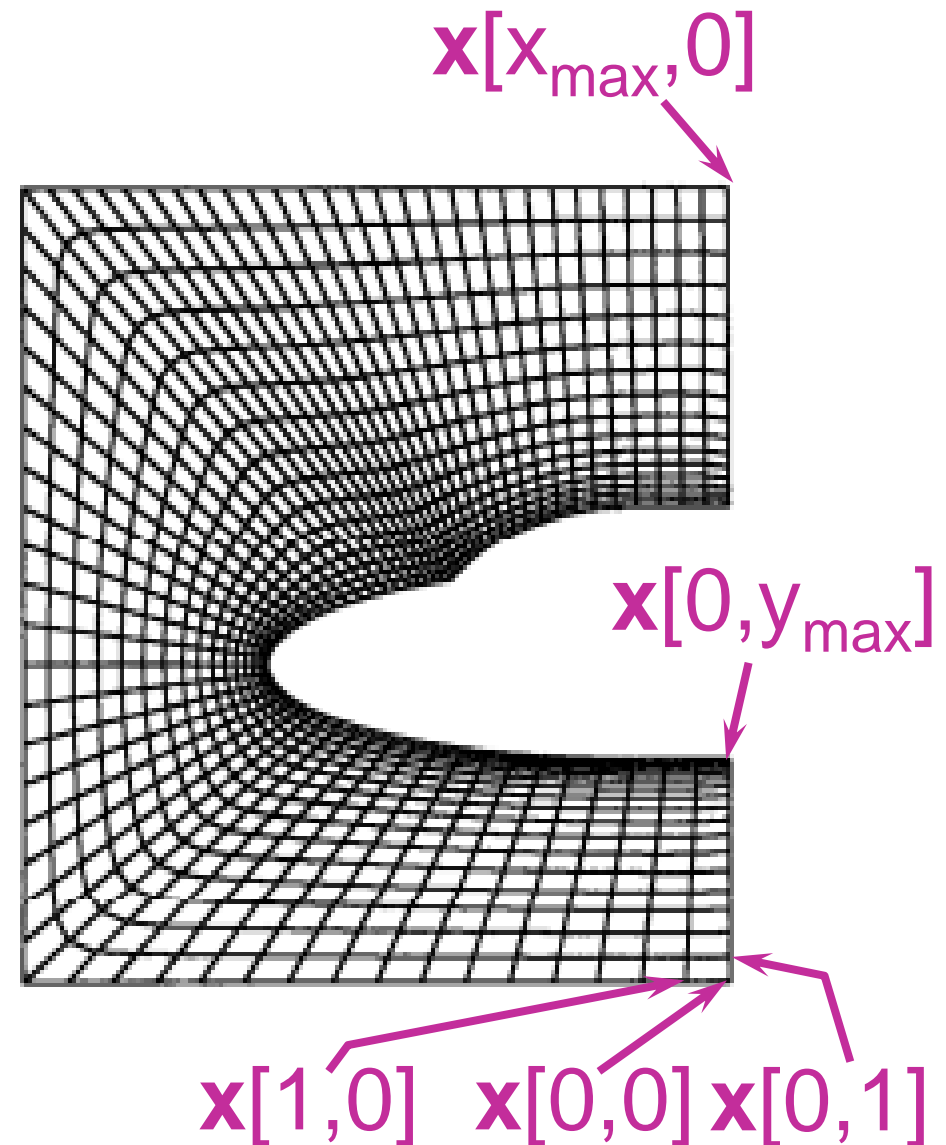

■ Rectilinear Grid

- ◆ varying sample-distances $x[i]$, $y[j]$

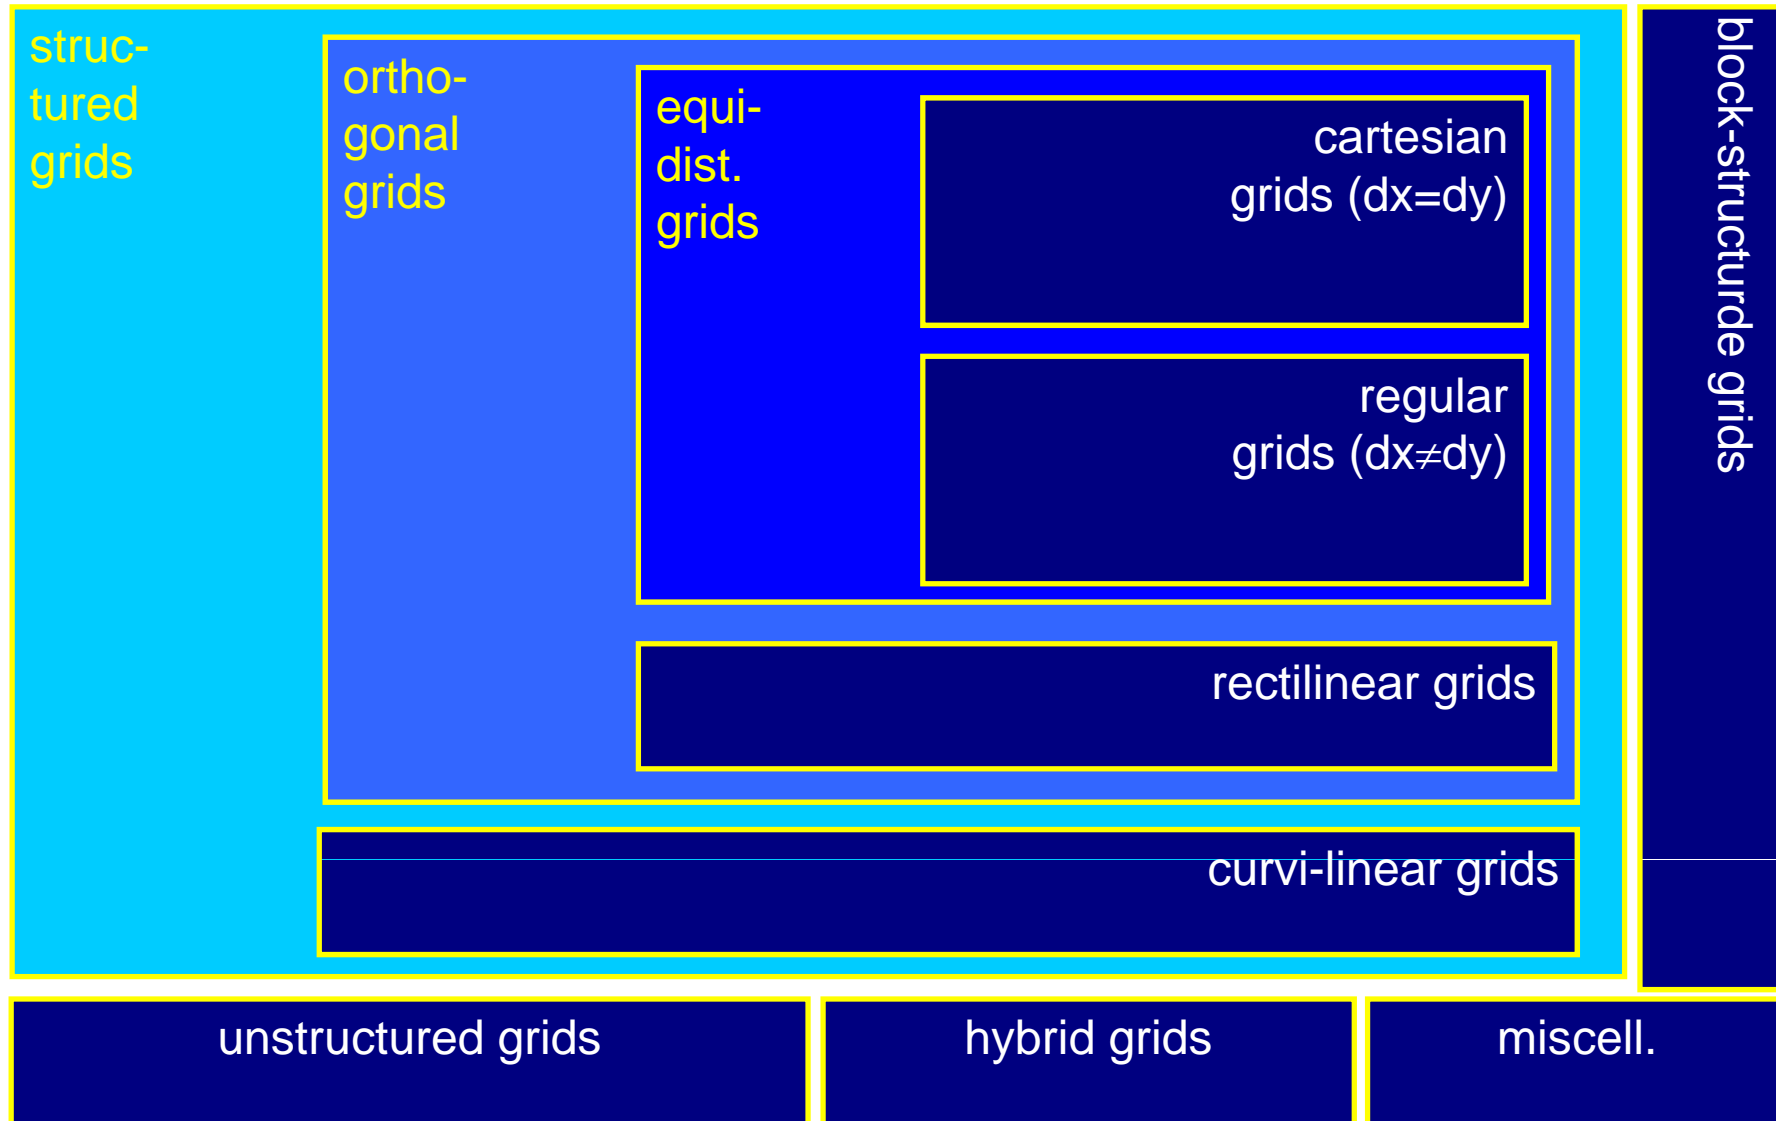

- Characteristics:
 - ◆ non-orthogonal grid
 - ◆ grid-points explicitly given ($\mathbf{x}[i,j]$)
 - ◆ Implicit neighborhood-relationship

- Characteristics:
 - ◆ Grid-points and connections arbitrary
 - ◆ Grid-points and neighborhood explicitly given
 - ◆ Cells: tetrahedra, hexahedra

Grids - Survey

- Characteristics:
 - ◆ Grid-free data
 - ◆ Data points given without neighborhood-relationship
 - ◆ Influence on neighborhood defined by spatial proximity
 - ◆ Scattered data interpolation

- Conversion between grids:
 - ◆ physical domain (simulation)
 - ◆ computational domain (visualization mapping)
 - ◆ image domain (rendering)
 - ◆ etc.
- Questions:
 - ◆ Accuracy of re-sampling!
 - ◆ Design of algorithms

Visualization and Color

Guidelines for the Usage of Color in Visualization

- Some facts:
 - ◆ Color can emphasize information
 - ◆ Number of colors only 7 ± 2
 - ◆ Appr. 50–300 shades distinguishable (different for different colors)
 - ◆ Rainbow color scale \neq linear!
 - ◆ Color perception strongly depends on context
 - ◆ Color blind users are handicapped
 - ◆ Observe color associations

- Desaturated lines as border of colored areas
- No saturated blue for details, animations
- do not mix saturated blue and red
(why? **therefore**)
- Avoid high color frequencies
- Colors to compare should be close
- Observe context, associations!
- Well suited: color for qualitative visualization
- Use redundancy (shape, style, etc.)
